This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, Washington, D.C., 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Box Provisional Application, Assistant Commissioner for Patents, Washington, D.C. 20231.

A. Brief summary of the invention:

This is a novel two stage projector architecture with less optical elements that is also more compact than the original one.

B. Background of the Invention:

In the previous art, the number of optical elements used for solving the problem of the contrast and contouring was 6 lenses of the imaging relay system needed for imaging one imager onto another. (See next figure).

FORM VERSION 3/13/02

The purpose of this new disclosure is to reduce the number of lenses to 3 ones, as low cost as the those used in the previous art and also making the system more compact.

C Description of the invention

The idea is to take advantage of the perfect symmetry of the above system to reduce the number of elements. In particular, there are 3 lenses before an aperture stop in the one to one relay lens, and three after the aperture stop. The relay system can be designed such as the first group of 3 lenses is absolutely identical to the second group of three lenses. And hence, we can imagine then using just the first group of 3 lenses and a mirror in the aperture stop to double pass the first 3 lenses which could enable us to get rid of the 3 lenses located after the aperture stop. The system would look like the following figures where the lens system element represents the group of three lenses. It is clearly seen that the dark state obtained by the first imager is modulated on a pixel basis by the second imager which is also driven in the same state so that the contrast of the dark state is boosted like in the previous disclosure, enabling at the same time to have a very high contrast system ($>40000:1$) and doubling the depth of addressing because we use two imagers. The system needs a polarized sequential field colour illumination or a polarized scrolling color illumination.

In the previous art, we had 6 lenses, here 3 lenses, a glass cube that is just here as a path equalizer for the relay lenses for both channels, and a mirror with a broadband

QWP laminated on it. So we have traded 3 lenses for a glass cube and a mirror+QWP but the system is already more compact than in the previous art.

The next step is to try to find out if the additional glass cube could be removed and replaced by just a distance from the first imager to the PBS that is different from the distance of the second imager to the PBS. This is not obvious at all, because the three lens element is used in a symmetrical double pass and it shall make the image of the first imager onto the second one with the same 7 constraints that we got in the disclosure about the previous art: telecentricity, low distortion, very good MTF, a speed of 2.8, magnification of -1 and inexpensive glasses. If we unfold the path, and constrain the design to have 2 identical group of three lenses and that both groups are at the same distance from the 2 PBSs whereas the imagers do not need to be at the same distance from the PBSs, the figure below shows an optimized configuration of the relay lens group that fulfills the requirements.

The two figures after that one show that the distortion is excellent and that the good MTF ensures a proper imaging of one imager onto the other one.

The performance summary for the lens is:

Effective Focal Length : 243.0867 (in air)
 Effective Focal Length : 243.0867 (in image space)
 Back Focal Length : -240.2476
 Total Track : 160.935
 Image Space E/# : 1.375713
 Paraxial Working F/# : 2.75153
 Working F/# : 2.79508
 Image Space NA : 0.1787892
 Object Space NA : 0.1788022
 Stop Radius : 4.552487
 Paraxial Image Height : 10.20077
 Paraxial Magnification : -1.000075
 Entrance Pupil Diameter : 176.6987
 Entrance Pupil Position : 466.3308
 Exit Pupil Diameter : 176.6987
 Exit Pupil Position : -486.2808
 Field Type : Object height in Millimeters
 Maximum Field : 10.2
 Primary Wave : 0.5876
 Lens Units : Millimeters
 Angular Magnification : 1

And it's prescription:
